CYLINDER **LINERS**

FOR ENGINES FROM
ASIAN MANUFACTURERS

TAKING RESPONSIBILITY IN A CHANGING WORLD

RHEINMETALL

SLIPFIT AND PRESSFIT

DIFFERENCE AND INSTALLATION

Vehicles from Asian manufacturers are very popular in all markets worldwide. Many of these vehicles are passenger cars, where overhauling the engine is not as common as it is on larger commercial vehicles. The Motorservice range also includes a number of cylinder liners for these engines, which are supplied in OEM quality.

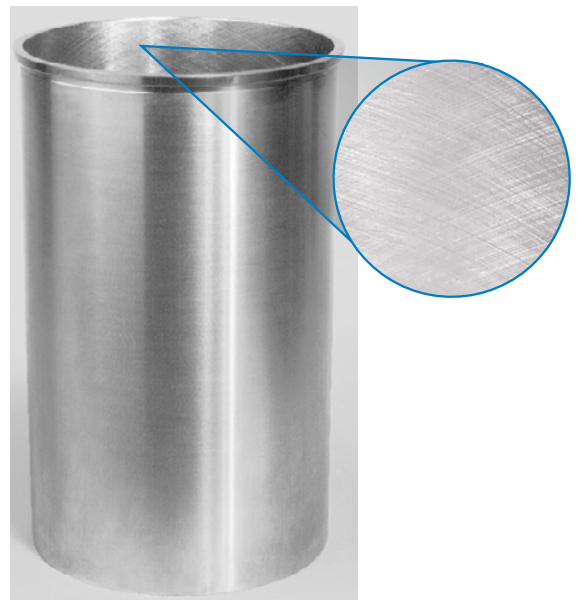

Motorservice has sales partners on five continents. This enables Motorservice to supply required spare parts quickly and reliably, even for time-sensitive applications. Timely delivery is particularly important when it comes to spare parts for commercial vehicles, generators or marine applications.

Depending on the type of installation, the cylinder liners are divided into Slipfit Liners and Pressfit Liners.

SLIPFIT LINERS

The item numbers for the Slipfit Liners end in -110.

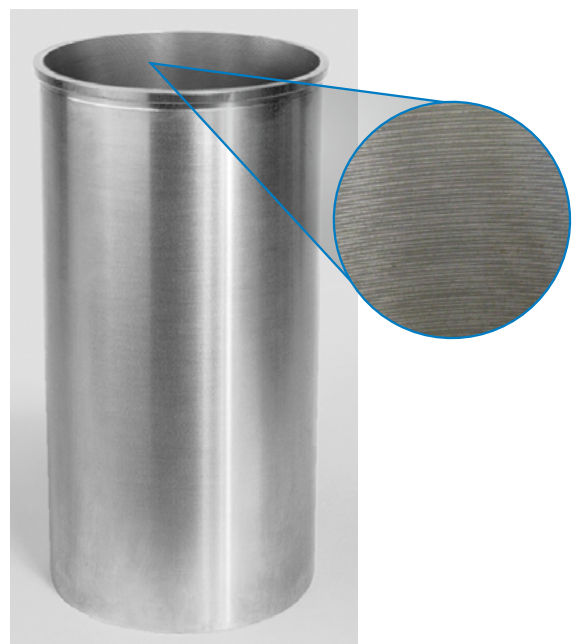

These repair cylinder liners can be installed by hand. No further machining is necessary. The cylinder sliding surface has already been honed. No further machining is necessary, which means that the cylinder liners can be replaced in a normal repair shop. The liners are also referred to as “finished” in the catalogue.

PRESSFIT LINERS

The item numbers for the Pressfit Liners end in -190.

These cylinder liners are installed by pressing them in. After this, the cylinder sliding surface needs to be drilled and honed. Due to these additional work steps, only reconditioning companies with the necessary equipment can install these types of cylinder liners.
