

Changes to fuel filter 158-FS

On fuel filter 158-FS, the support of the inner sealing ring has changed. Instead of the plastic mount for the sealing ring, the gasket is now integrated into the metal lid as well. The omission of the plastic mount means that a better resistance to chemical and thermal influences is achieved.

No changes have been made to the construction and the inner workings of the fuel filter.

 **Note:**
No technical differences have arisen as a result of the change.
