

Packaging change

Bearing sets for truck and heavy duty applications

As of August 2011 improved packaging will be gradually phased in for the bearing sets for truck and heavy duty applications. Until now the engine bearings have been attached to the backing cardboard using shrink wrap.

The new packaging method means that the bearing shells are secured directly onto the cardboard using a layer of plastic film on the upper surface for an even more secure grip, meaning larger packaging can be used.

The contents and the article numbers of the bearing sets remain unchanged.
